

Proposal: PropertyMax.ai Operations Hub via Microsoft SharePoint

Executive Summary

As PropertyMax.ai continues to scale, our operational data—including daily summary reports, manager KPIs, and market rent comparables—needs a centralized, secure, and automated home. Currently, data is siloed across individual files and platforms, making it difficult to maintain a single source of truth or integrate seamlessly with our project management tools (ClickUp, Monday.com, Notion).

This proposal outlines the creation of a **PropertyMax.ai Operations Hub** built on our existing Microsoft Exchange/Microsoft 365 infrastructure using **SharePoint**. This approach requires no new software subscriptions, leverages our current security protocols, and enables fully automated data updates and cross-platform embedding.

Core Objectives

The primary goal of the Operations Hub is to establish a secure, automated environment that hosts our critical operational data. By utilizing SharePoint, we can achieve the following:

- Centralized Hosting:** Create a single, authoritative repository for the Rent Comparables workbook, Daily Summary Reports, and Manager KPI trackers.
- Seamless Integration:** Generate permanent, live-updating embed links that can be placed directly into ClickUp, Monday.com, or Notion dashboards.
- Automated Workflows:** Utilize Microsoft Power Automate to schedule regular data refreshes (e.g., monthly rent comp updates, daily report generation) without manual intervention.
- Access Control:** Maintain strict permission levels, ensuring managers only see data relevant to their specific properties while leadership retains a macro view.

Proposed Architecture

The Operations Hub will be structured into dedicated libraries and pages within a new SharePoint site, designed for intuitive navigation and automated data flow.

Hub Component	Function & Automation Strategy
Rent Comparables Database	Hosts the master 4COMPS workbook. The file will be embedded into our project management tools via Excel Online. Power Automate will be configured to pull fresh market data monthly and update the sheet automatically.
Manager KPI Dashboards	A dedicated page featuring embedded Excel Online KPI trackers. The scoring system will automatically adjust for staff size and vacancy rates, tracking metrics like “The 5 Golden Questions” and prospect-to-tenant conversion rates.
Daily Summary Reports	A document library organized by date. Power Automate will generate daily reports (including percentage differences from the previous day and exact building vacancy percentages) and deposit them here automatically every morning.
Property Document Vault	Secure storage for leases, inspection reports, and compliance documents, organized by property and accessible only to authorized personnel.

Implementation Strategy

The transition to the SharePoint Operations Hub will be executed in three distinct phases to ensure minimal disruption to current workflows.

Phase 1: Infrastructure Setup We will create the PropertyMax.ai SharePoint site and establish the core document libraries. The finalized Rent Comparables workbook will be uploaded, and permanent shareable links will be generated and embedded into our existing ClickUp/Monday.com workspaces.

Phase 2: KPI and Reporting Automation We will design the Manager KPI tracker templates, ensuring they incorporate fair scoring criteria across all properties. Power Automate flows will be built to generate the Daily Summary Reports, formatting

financial values precisely (e.g., \$#,###.##) and calculating daily percentage changes and vacancy rates.

Phase 3: Scheduled Data Refreshes The final phase involves connecting Power Automate to our external data sources. This will enable the Rent Comparables workbook to update automatically on a monthly schedule, ensuring our embedded dashboards always display the most current market data without manual data entry.

Conclusion

Building the PropertyMax.ai Operations Hub on SharePoint maximizes the value of our existing Microsoft 365 investment. It solves our immediate need for hosting and embedding the Rent Comparables workbook while laying the foundation for fully automated daily reporting and KPI tracking. This infrastructure will significantly reduce manual administrative work, ensure data accuracy across all platforms, and provide leadership with real-time visibility into portfolio performance.
