

Connecteam GPS Off-Site Report

Execution access and policy checklist

This checklist covers the analysis of **Sandra Crump's** clocked-in location data from **January 1, 2026 through August 10, 2026**. The report will identify time outside all applicable Connecteam geofences and keep **verified**, **inferred**, and **unknown** time separate. Please complete the items below before I begin.

1. Authorization and scope

- ☐ Organization authorization Confirm that you are authorized to provide and direct review of Sandra Crump's Connecteam time-clock and GPS-location records for this purpose.
- ☐ Employee identity Confirm the employee is exactly "Sandra Crump." If Connecteam contains more than one matching name, provide the correct email address or employee ID.
- ☐ Reporting period Confirm the inclusive period: January 1, 2026 through August 10, 2026, in the company's Connecteam timezone.
- ☐ Report purpose State the intended purpose: internal operational review, payroll review, compliance review, or other.
- ☐ Location privacy This prevents a location analysis from being used outside its approved purpose. Confirm that the organization's applicable employee notice, consent, and retention requirements permit this review.

2. Choose one access route

- | Choice | What you provide | What I will use it for |
|--|---|--|
| ☐ A — Preferred API | A new, revocable, read-only Connecteam API key with Time Clock records, and daily Breadcrumbs JSON exports. This is the most read access, provided in a secure attachment or approved credential channel. Do not send it in ordinary email or public chat. | Retrieve users, time clocks, current geofence definitions, shift complete and reproducible path. |
| ☐ B — Authenticated browser | An authorized administrator logs in to Connecteam in the connected browser required verification prompts. | Assess and use official export capabilities available to the account. This is a fallback; it may not permit the same complete historical session and remains available for any extraction as API access. |

Important: If historical Breadcrumbs tracking was not enabled for a shift, there may be no GPS trail to analyze. Such shifts will be reported as **GPS data unavailable** rather than assumed to be on-site or off-site. A Connecteam API key is equivalent to a password; create a dedicated key and revoke it after delivery if no longer needed.

3. Confirm the calculation policy

- ☐ Principal number Approve **Strict Total** as the primary result: only GPS-supported, verified off-site time. This is the recommended default.
- ☐ Secondary number Approve a separate **Review Total**: verified off-site time plus clearly labeled inferred time between reliable observations.
- ☐ Unknown time Approve separate reporting of GPS gaps, disabled-location periods, and boundary-accuracy ambiguity. Unknown time will **not** be included in either total without written direction.
- ☐ Geofence rule Confirm that "on-site" means inside any enabled geofence assigned to the relevant Connecteam time clock, unless you provide a different job- or location-specific policy.
- ☐ Break rule Choose one: ☐ exclude unpaid breaks; ☐ include paid breaks; ☐ use the shift records exactly as configured in Connecteam; ☐ other: _____.
- ☐ Review threshold Identify any threshold that should trigger a manual review, for example: individual off-site interval over _____ minutes or daily strict total over _____ minutes.

4. Optional context that improves interpretation

- ☐ Known exceptions Provide any dates, work orders, client-site assignments, approved travel, job changes, or temporary site rules that may explain off-site movement.
- ☐ Current geofence changes Tell me whether geofences were added, removed, or resized during the period. The exported configuration is a current snapshot, so historic changes should be identified when known.
- ☐ Output recipient State who may receive the report and whether the raw GPS evidence package should be restricted to a separate authorized recipient.

5. What you will receive

Daily manager report	Each day's clocked-in shift span, verified off-site time, inferred off-site time, unknown GPS time, strict total, review total, and concise exceptions.
Interval evidence file	One row per classified interval with timestamps, duration, classification, time clock, and supporting event/geofence information.
Methodology and exceptions	The approved calculation policy, data-quality flags, reconciliation results, and limitations.
Restricted source archive	Original Breadcrumbs exports, retrieved shift/geofence data, and integrity manifest. This is delivered only if you authorize its receipt and secure storage.

Return this checklist with your selected access route and completed confirmations. Once access is available, I will run a read-only extraction, preserve the source evidence, reconcile the results to shifts, and deliver the report.

Reference: why the API route is preferred

Connecteam's official Breadcrumbs report exports GPS motion, geofence ENTER/EXIT, and device-provider events for one company-timezone day at a time; it must be requested, polled, and downloaded promptly. The report is grouped by employee and shift, while Time Activities supplies the matching clock-in/clock-out record and Geofences supplies the exact center and radius for each time clock. The API requires eligible Time Clock access and supports an API key or OAuth authorization.[1] [2] [3] [4]
