

REST API Integration Request — ApartmentCorp Operations Hub

From: Brandon Rose, Special Projects — ApartmentCorp

To: PropertyMax.ai Development Team

Re: Read-Only REST API for Manager KPI Dashboard Integration

Overview

We have built an internal Operations Hub web application at **operationshub-aptpcorp.manus.space** that consolidates all of our operational data into one dashboard for our COO and leadership team. We are requesting a **read-only REST API** so our hub can pull live data directly from PropertyMax.ai instead of relying on manual data entry.

The API only needs to **GET (read) data** — we are not asking to write, modify, or delete anything in PropertyMax.ai.

Developer Checklist

Please work through the items below in order. Each section is self-contained.

✓ STEP 1 — Authentication Setup

- ☐ Create a **dedicated API key** for ApartmentCorp's Operations Hub (read-only access only)
- ☐ Confirm the authentication method: **Bearer Token in the Authorization header**
 - Example: `Authorization: Bearer <API_KEY>`

- ☐ Provide us with:
 - ☐ The **base URL** for all API calls (e.g. `https://api.propertymax.ai/v1`)
 - ☐ Our **API key**
 - ☐ Any **rate limits** we should be aware of (requests per minute/hour)
-

✓ STEP 2 — Manager Directory Endpoint

This is the most important endpoint. It powers the **Manager KPI Dashboard**.

Endpoint: `GET /managers`

- ☐ Return a list of **all managers** in our account including:

Field	Type	Example
<code>manager_id</code>	string	<code>"mgr_001"</code>
<code>name</code>	string	<code>"Blake Weddington"</code>
<code>role</code>	string	<code>"Property Mgr"</code> or <code>"Regional Mgr"</code> or <code>"Assistant"</code>
<code>property_name</code>	string	<code>"Gates on Manhattan"</code>
<code>property_id</code>	string	<code>"gates"</code>
<code>region</code>	string	<code>"R1"</code> , <code>"R2"</code> , <code>"R3"</code> , <code>"R4"</code> , or <code>"R5"</code>
<code>dashboard_url</code>	string	Direct URL to their PropertyMax dashboard
<code>last_login</code>	ISO datetime	<code>"2026-05-04T09:30:00Z"</code>

✓ STEP 3 — Manager KPI Endpoint

This is the core data feed. It powers every card on the KPI Dashboard.

Endpoint: `GET /managers/{manager_id}/kpis`

(or a bulk version: `GET /managers/kpis` returning all managers at once — preferred)

- ☐ For **each manager**, return the following KPI groups:

3a — Tasks (4 values)

Field	Type	Description
tasks_my	integer	Count of “My Tasks” currently open/pending
tasks_guest_card	integer	Guest Card tasks open
tasks_maintenance	integer	Maintenance tasks open
tasks_rent	integer	Rent-related tasks open

3b — Appointments (1 value)

Field	Type	Description
appointments	integer	Scheduled appointments count

3c — Call Recordings (5 values)

Field	Type	Description
calls_marketing	integer	Marketing call recordings
calls_urgent	integer	Urgent call recordings
calls_rent	integer	Rent-related call recordings
calls_maintenance	integer	Maintenance call recordings
calls_voicemail	integer	Voicemail count

3d — Guest Cards (5 values)

Field	Type	Description
guest_cards_prospects	integer	Prospect guest cards
guest_cards_tenants	integer	Tenant guest cards
guest_cards_vendors	integer	Vendor guest cards
guest_cards_jobs	integer	Job-related guest cards
guest_cards_other	integer	Other guest cards

3e — Performance Score (1 value)

Field	Type	Description
golden_score	integer (0–100)	Overall performance/Golden Score

STEP 4 — Vacancy / Occupancy Endpoint

This powers the **Daily Vacancy Report** and **Home Page Portfolio Overview**.

Endpoint: GET /properties/vacancy

- ☐ Return one row per property with:

Field	Type	Description
property_id	string	Unique building ID
property_name	string	Display name
total_units	integer	Total unit count
vacant	integer	Currently vacant
vac_unleased	integer	Vacant and not leased
vac_preleased	integer	Vacant but pre-leased
on_notice	integer	Residents who gave notice
eviction	integer	Units in eviction process
occupancy_rate	decimal	e.g. 97.2
change_vs_yesterday	integer	Negative = leased, positive = new vacancy
assigned_manager_id	string	Links back to manager
report_date	ISO date	"2026-05-04"

✓ STEP 5 — Marketing / Referral Source Endpoint

This powers the **Marketing Reports** section.

Endpoint: GET /properties/{property_id}/marketing
(with optional query params: ?from=2026-01-01&to=2026-05-04)

☐ Return referral source counts:

Field	Type	Description
property_id	string	Building identifier
period_start	ISO date	Start of reporting period
period_end	ISO date	End of reporting period
referrals	array	List of { source: string, count: integer }

Example referrals array:

```
[
  { "source": "Apartments.com", "count": 42 },
  { "source": "Google", "count": 31 },
  { "source": "Friends & Family", "count": 18 },
  { "source": "Driveby", "count": 12 },
  { "source": "Facebook", "count": 9 },
  { "source": "AffordableHousing.com", "count": 7 }
]
```

✓ STEP 6 — Response Format Standards

Please follow these standards on **every endpoint**:

- ☐ All responses return **JSON** (Content-Type: application/json)
- ☐ Every response includes a top-level **last_updated** timestamp in ISO 8601 format
 - Example: "last_updated": "2026-05-04T14:00:00Z"
- ☐ All **dates** use ISO 8601 format (YYYY-MM-DD or YYYY-MM-DDTHH:MM:SSZ)
- ☐ All **dollar amounts** are numbers, not strings (e.g. 1250.00 not "\$1,250")
- ☐ All **percentages** are decimals, not strings (e.g. 97.2 not "97.2%")
- ☐ Return **HTTP 200** for success, **HTTP 401** for invalid API key, **HTTP 404** for not found
- ☐ Wrap all data in a consistent envelope:

```
{
  "last_updated": "2026-05-04T14:00:00Z",
  "count": 30,
  "data": [ ... ]
}
```

✅ STEP 7 — CORS Configuration

Our Operations Hub is hosted at:

- `https://operationshub-aptcorp.manus.space`
- `https://aptcorp-dash-jrabqjrz.manus.space`
- [] Add both domains to the **CORS allowed origins** list so our web app can call the API directly from the browser
- [] Alternatively, confirm if all calls must be **server-to-server** (we can accommodate either)

✅ STEP 8 — Documentation & Testing

- ☐ Provide a **Postman collection** or **Swagger/OpenAPI spec** so we can test all endpoints before integration
- ☐ Provide at least **one sample response** per endpoint with realistic data
- ☐ Confirm whether there is a **sandbox/test environment** we can use during development

Priority Order

If you need to phase the rollout, please prioritize in this order:

1. **Authentication + Manager Directory** (Steps 1–2) — needed to map managers to their data
2. **Manager KPIs** (Step 3) — the core of the dashboard

3. **Vacancy/Occupancy** (Step 4) — already partially working via our existing Vacancy App
 4. **Marketing Referrals** (Step 5) — nice-to-have for Phase 2
 5. **Response Standards + CORS** (Steps 6–7) — needed before go-live
-
