

How to Install Docker on Ubuntu

Below are the terminal commands to download and install Docker Engine on an Ubuntu system using the official Docker repository.

1. Update package index and install prerequisites

Update the `apt` package index and install packages to allow `apt` to use a repository over HTTPS:

```
sudo apt-get update
sudo apt-get install ca-certificates curl
```

2. Add Docker's official GPG key

Create the keyrings directory and download the GPG key:

```
sudo install -m 0755 -d /etc/apt/keyrings
sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg -o /etc/apt/
sudo chmod a+r /etc/apt/keyrings/docker.asc
```

3. Set up the repository

Add the Docker repository to your APT sources:

```
echo \
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docl
$(. /etc/os-release && echo "$VERSION_CODENAME") stable" | \
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

4. Install Docker Engine

Update the package index again and install the latest version of Docker Engine, containerd, and Docker Compose:

```
sudo apt-get update
sudo apt-get install docker-ce docker-ce-cli containerd.io docker-buildx-
```

5. Verify the installation

Verify that the Docker Engine installation is successful by running the `hello-world` image:

```
sudo docker run hello-world
```

(Optional) Post-installation steps for Linux

If you don't want to preface the `docker` command with `sudo`, create a Unix group called `docker` and add users to it:

```
sudo groupadd docker
sudo usermod -aG docker $USER
```

(Note: You will need to log out and log back in for this to take effect.)
